# Guidance

## Hypo risk

Investigate possible sources for a high hypo risk. Attempt to reduce your hypo risk before you change other blood glucose deviations. Take into account exercise type, frequency, point in time and duration; size and composition of meals/snacks; time of administration and dose of medication; illnesses; stress and changes to state of health.

## Variability

Investigate possible sources for moderate variability. Take into account exercise type, frequency, point in time and duration; size and composition of meals/snacks; time of administration and dose of medication; illnesses; stress and changes to state of health.
